

Solvent inks have long been used for their superior laydown and high percentage of pigments, which produce outstanding color and quality. Now, for the first time ever, CTI introduces solvent-based Photochromic and Glow-in-the-Dark inks for high-end, large quantity consumer packaged goods. Contact us today to qualify these inks and anticipate brand requests.

PHOTOCHROMIC INK

Nearly invisible indoors, these inks burst into color when taken into sunlight and then revert back to colorless after a few minutes out of the sun. They're a great way to design interactive packaging features and engage consumers in ways that lift brand recognition, loyalty and sales.

Available Colors:

- Red
- Orange
- Blue
- Purple
- Yellow
- Green

GLOW-IN-THE-DARK INK

We have taken traditional Glow-in-the-Dark (GID) ink to the next level by developing it for use in solvent-based Flexographic printing. There are many safety and promotional applications for these inks, including Halloween and nighttime events. CTI has a proprietary formula for the best quality and glow in the industry, as well as design tips for optimizing for GID ink. (For instance, we strongly recommend printing GID against a white background).
